

Nanosensor Arrays: Integrating Nano-Scale Sensors and VLSI Processing Circuitry

Vijaykrishnan Narayanan
Embedded and Mobile
Computing Design Center
Pennsylvania State University

Motivation

- ◆ **Electronic noses:** a chemical sensing system that contains an array of several different types of sensors, where each element measures a different property of the sensed chemical
- ◆ **Applications:**
 - . detecting hazardous emissions from chemical plants
 - . detection and control of automobile emissions
 - . odor control in chemical and food processing
 - . discrimination of breath alcohol constituents

Outline

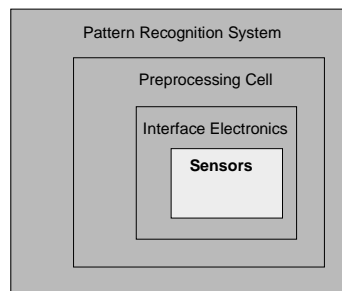

- ◆ **Nanowire sensor background**
- ◆ **Interface Electronics**
- ◆ **Signal Processing For Gas Detection**
- ◆ **Signal Processing For Gas Classification**

Chemiresistive Sensors

Responses of three polymer sensor films when exposed to three gases

By integrating the responses from different types of sensor array, a distinctive pattern or signature is produced for each chemical gas.

Going from macro to nano scale

- ◆ **Low cost:** batch fabricated
- ◆ **Low power consumption:** Individual nanowires will dissipate on the order of tenths of mW; long term battery-powered operation becomes possible for small arrays
- ◆ **Massive redundancy :** fault tolerant, high sensitivity

Electric Field-Driven Assembly

- AC field is used to induce long range forces to drive nanowire alignment between pairs of pre-patterned electrodes.
- If nanowire is more polarizable than the medium in which it is suspended, dielectrophoresis force will cause the nanowire to move in the direction of highest field strength.
- Once one wire is aligned, field strength = 0, and wire is fixed in its location

Alignment of 200nm diameter, 5 μ m long Au nanowires

Sensor Area

| Pitch | BE Width | Area (µm ²) |
|-------|----------|-------------------------|
| 1.5µm | 1.5µm | 643 x 10.5 |
| 6µm | 3µm | 655 x 24 |
| 10µm | 1.5µm | 643 x 36 |

>4 x 4 Sensor Array
 >Total 4 pairs of electrodes.
 >200µm between 2 pairs of electrodes.

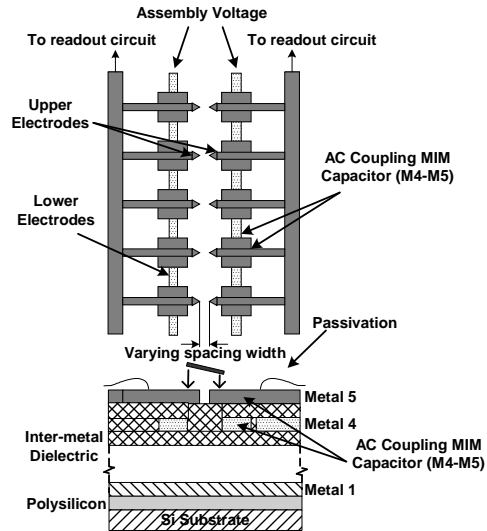

| Pitch | BE Width | Area (µm ²) |
|-------|----------|-------------------------|
| 1.5µm | 1.5µm | 1483 x 22.5 |
| 6µm | 3µm | 1507 x 54 |
| 10µm | 1.5µm | 1483 x 72 |

>8 x 8 Sensor Array
 >Total 8 pairs of electrodes.
 >200µm between 2 pairs of electrodes.

Interface Electronics

Signal Conditioning (Wheatstone Bridge)

Benefits

- Standard Circuit

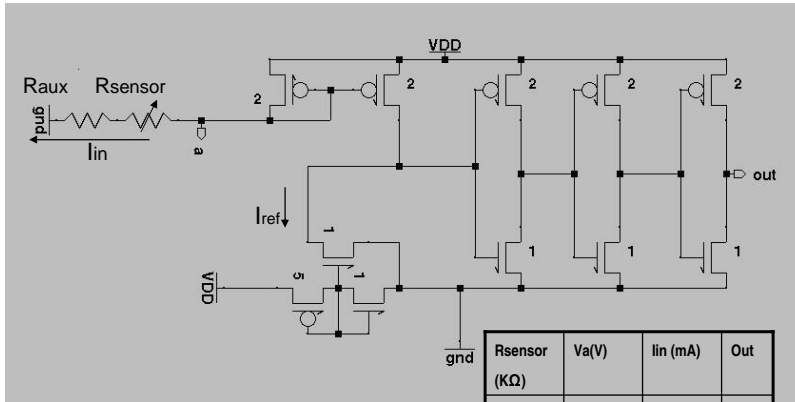

Disadvantages

- Errors due to contact resistance
- Difficult to fabricate resistors precisely
- Non-linear response when sensors > 1

MPSoc 2004

Interface Electronics

Example:

$R_{aux}=1.2K \Omega$, $V_{DD}=3.7V$, $I_{ref}=0.31mA$

Assume $R_{sensor}=3K \Omega$ (no gas)

$\Delta R=0.3K \Omega$ (gas exists)

| Rsensor (K Ω) | Va(V) | Iin (mA) | Out |
|-----------------------|-------|----------|-----|
| 3 | 1.35 | 0.321 | 0 |
| 3.1 | 1.36 | 0.316 | 0 |
| 3.2 | 1.38 | 0.314 | 0 |
| 3.3 | 1.39 | 0.308 | 1 |
| 3.5 | 1.42 | 0.302 | 1 |

Interface Electronics

Size of ADC: $8.71 \times 7.23 = 63 \mu\text{m}^2$, $0.25 \mu\text{m}$ Technology

MPSoc 2004

© MDP . PSU

Interface Electronics

Signal Conditioning (Anderson Loop)

Benefits

- Insensitive to contact voltage losses
- 2x gain compared to Wheatstone
- Necessarily linear output for N sensors
- Only one reference resistor for each loop

Disadvantages

- Slightly more complex circuit

Gas Detection – Operating Phases

Step 1: Training --> mark all the “bad” sensors

Step 2: Computing signature feature vector

Step 3: Processing data, get feature vector

Step 4: Final gas detection (compare feature vector with signature feature vector), using Least Square Estimation

Step 4: Pattern recognition-Least Squares Approach

LS error criterion
 $J(\theta) = \sum_{n=0}^{N-1} (X[n] - S_{\theta}[n])^2$

The value of θ that minimizes $J(\theta)$ is the LSE

Least squares error

MPSoC 2004

© MDP . PSU

Apply LSE to our problem

$S_0 = \{0, 0, 0, 0 \mid \theta = \text{No Gas}\}$

$S_1 = \{3, 5, 6, 3 \mid \theta = \text{Gas Detected}\}$

$X = \{1, 3, 4, 3\}$

◆ $J(0) = \sum_{n=0}^{N-1} (X[n] - S_0[n])^2 = (1-0)^2 + (3-0)^2 + (4-0)^2 + (3-0)^2 = 35$

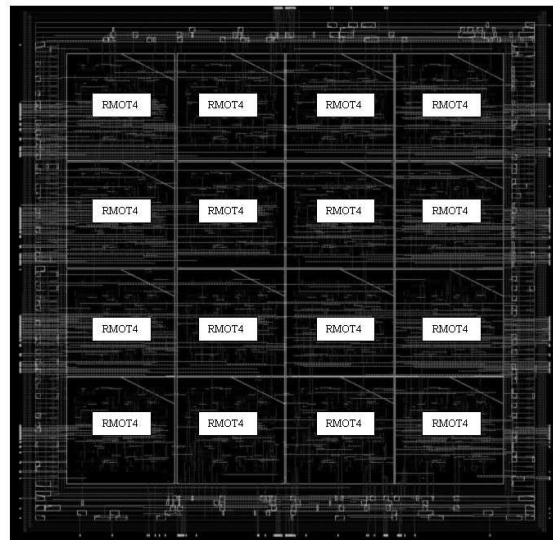

◆ $J(1) = \sum_{n=0}^{N-1} (X[n] - S_1[n])^2 = (1-3)^2 + (3-5)^2 + (4-6)^2 + (3-3)^2 = 12$

◆ $J(1) < J(0) \rightarrow \text{Gas Detected}$

Cross Reactive Sensor Arrays

System Operation

- ◆ System consists of 32x32 pairs of sensors, each sensor connected to an ADC, and a 32x32 cell array
- ◆ *Training Phase:* each cell corresponding to a 2-D space location is assigned a gas label by exposing it to known gases
- ◆ *Detection Phase:* system is exposed to unknown gases

MPSoC 2004

© M_D . PSU

Training Phase

- ◆ ***feature extraction step:*** sample points that correspond to responses of “known” gases are labeled and presented to the classifier to form its knowledge base
- ◆ ***cell expansion step:*** the nearest neighbors of these sample points are identified in successive time periods and source labels are populated in the 2-D space.

Cell Expansion—boundary formation

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | | S | | |
| | | | | | S | S | S | |
| | | L | | S | S | S | S | S |
| | L | L | X | S | S | S | S | S |
| L | L | L | L | X | S | S | S | S |
| L | L | L | L | L | X | S | S | |
| L | L | L | L | L | | S | | |
| | L | L | L | | | | | |
| | | L | | | | | | |

MPSoC 2004

©  . PSU

Detection Phase

- ◆ **feature extraction step:** the feature for the unknown gas is extracted
- ◆ **identification step:** the gas label of the unknown gas is read from the appropriate cell using the feature coordinates
